

e@syFile Errors

Invalid code Source Codes should be exactly 4 digits

Background

When you submit your declaration on e@syFile to SARS, the following Submission error appears:

When you refer to the Pre-Submission Validation Report, the following FAILED message appears:

Invalid code "; Source Codes should be exactly 4 digits

Possible Solution:

The IRP5 file imported successfully, without errors. The error message indicates that there are unwanted commas in the data, usually in one of the address or name fields. The error message from e@syFile does not indicate the record with the unwanted commas.

- Open Excel, and open the IRP5 file
- On the Text Import Wizard, select Delimited, and click Next
- Change delimiter to Comma
- Click on Finish
- Press CTRL-F to bring up the search block, and search for , (a comma)
- This will indicate which record in the file has the issue, and this should be corrected in payroll, and a new file should be generated
