

e@syFile Errors

Invalid format ... for code...

Background

When importing the IRP5 file into e@syFile the file fails and the error appears on the Import Payroll File Log

Possible Solution:

- Ensure the Regional Settings of the computer are correct to create the export file. Click [here](#) for Windows 7 settings and [here](#) for Windows 10.
- Access the IRP5 file in notepad and find the applicable record mentioned in the error
- Validate that the value is correct on the applicable certificate, IRP5 code and value (check if there is double full stops or strange characters)
- Import the file in a clean e@syFile database to validate if the error appears again. Should it import with success, it means the e@syFile database might be corrupt, and you will not be able to use this database for submission
